Question #211

HOTSPOT -
You need to manage Azure by using Azure Cloud Shell.
Which Azure portal icon should you select? To answer, select the appropriate icon in the answer area.
Hot Area:

Correct Answer:

You can access Azure Cloud Shell in the Azure portal by clicking the icon.
Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.
Cloud Shell enables access to a browser-based command-line experience built with Azure management tasks in mind.

Question 26 Share

Question #212

You have a virtual machine named VM1 that runs Windows Server 2016. VM1 is in the East US Azure region.
Which Azure service should you use from the Azure portal to view service failure notifications that can affect the availability of VM1?

A Azure Service Fabric

B Azure Monitor **Most Voted**

C Azure virtual machines

D Azure Advisor

Correct Answer:
B
In the Azure virtual machines page in the Azure portal, there is a named Maintenance Status. This column will display service issues that could affect your virtual machine. A service failure is rare but host server maintenance that could affect your virtual machines is more common.
Azure periodically updates its platform to improve the reliability, performance, and security of the host infrastructure for virtual machines. The purpose of these updates ranges from patching software components in the hosting environment to upgrading networking components or decommissioning hardware.

Question 48 Share

Question #213

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your Azure environment contains multiple Azure virtual machines.

You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

Solution: You modify an Azure Traffic Manager profile.

Does this meet the goal?

A Yes

B No

Correct Answer:
B

Azure Traffic Manager is a DNS-based load balancing solution. It is not used to ensure that a virtual machine named VM1 is accessible from the Internet over
HTTP.

To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you need to modify a network security group or Azure Firewall.

In this question, we need to add a rule to a network security group or Azure Firewall to allow the connection to the virtual machine on port 80 (HTTP).

Question 31 Share

Question #214

Your company plans to deploy several web servers and several database servers to Azure.
You need to recommend an Azure solution to limit the types of connections from the web servers to the database servers.
What should you include in the recommendation?

A network security groups (NSGs) Most Voted

B Azure Service Bus

C a local network gateway

D a route filter

Correct Answer:
A
A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine.
You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

Question #215

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

From [Azure Access Control IAM / Azure Event Hubs / Azure Activity Log / Azure Service Health] you can view which user turned off a specific virtual machine during the last 14 days.

Correct Answer:

Answer Area

From [Azure Access Control IAM / Azure Event Hubs / Azure Activity Log / Azure Service Health] you can view which user turned off a specific virtual machine during the last 14 days.

You would use the Azure Activity Log, not Access Control to view which user turned off a specific virtual machine during the last 14 days.
Activity logs are kept for 90 days. You can query for any range of dates, as long as the starting date isn't more than 90 days in the past.
In this question, we would create a filter to display shutdown operations on the virtual machine in the last 14 days.

Question 21 Share

Question #216

Which service provides network traffic filtering across multiple Azure subscriptions and virtual networks?

A Azure Firewall **Most Voted**

B an application security group

C Azure DDoS protection

D a network security group (NSG)

Correct Answer:
A
You can restrict traffic to multiple virtual networks in multiple subscriptions with a single Azure firewall. Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.
You can centrally create, enforce, and log application and network connectivity policies across subscriptions and virtual networks. Azure Firewall uses a static public IP address for your virtual network resources allowing outside firewalls to identify traffic originating from your virtual network.

Question #217

Which Azure service should you use to store certificates?

A Azure Security Center

B an Azure Storage account

C Azure Key Vault **Most Voted**

D Azure Information Protection

Correct Answer:
C
Azure Key Vault is a secure store for storage various types of sensitive information including passwords and certificates.
Azure Key Vault can be used to Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets.
Secrets and keys are safeguarded by Azure, using industry-standard algorithms, key lengths, and hardware security modules (HSMs). The HSMs used are
Federal Information Processing Standards (FIPS) 140-2 Level 2 validated.
Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they are allowed to perform.

Question #219

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Sentinel stores collected events in an Azure Storage account.	○	○
Azure Sentinel can remediate incidents automatically.	○	○
Azure Sentinel can collect Windows Defender Firewall logs from Azure virtual machines.	○	○

Correct Answer:

Answer Area

Statements	Yes	No
Azure Sentinel stores collected events in an Azure Storage account.	○	○
Azure Sentinel can remediate incidents automatically.	○	○
Azure Sentinel can collect Windows Defender Firewall logs from Azure virtual machines.	○	○

Question #220

DRAG DROP -
Match the Azure Services service to the correct descriptions.
Instructions: To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.

Select and Place:

Correct Answer:
Incorrect Answer:
Box 1: Azure Sentinel -

Box 2: Azure Security Center -

Box 3: Azure Key Vault -
☞ Azure Active Directory (Azure AD)
Azure AD is an identity and access management service, which helps your employees sign in and access resources
☞ Azure Lighthouse
Azure Lighthouse is used for cross- and multi-tenant management.
